Proaquatix is an aquaculture company engaged in the production of marine ornamental fish and macroalgae. Established in 2001 and under new management since 2008, Proaquatix has been steadily expanding its availability list of aquacultured, meaning captive bred, products, which include various species of clownfish, gobies, blennies, basslets, gamefish and macroalgae to both wholesalers and retailers around the world.

The benefits of aquacultured products over their wild-caught counterparts have been widely documented. Aquacultured products are environmentally friendly since nothing is taken from the wild, and all production is done in closed systems, which eliminate the potential for pollution. Survival rates of fish and macroalgae, during and after shipping are also much higher. This is a reoccurring problem with shipments of wild caught specimens, which frequently experience high mortality rates. Aquacultured fish tend to adapt very easily to aquarium life because they are raised under similar conditions. Through selective breeding, desirable traits can be passed on from generation to generation. The new “designer clownfish” movement is a result of such selection, where beautiful colors and patterns never seen before in wild caught clownfish are now widely available to the public. Proaquatix products are 100 percent American, every single fish that leaves the facility to the market is born and raised right here in our hatchery in Vero Beach. Proaquatix strives to offer a high quality and consistent product with steady availability.

Proaquatix is committed to the long-term sustainability of the marine aquarium hobby. By investing in research in order to continue to expand the list of captive bred marine fishes, we are helping reduce the pressure put on our reef ecosystems around the globe. Every fish produced in our hatchery is one less fish taken from the wild! We believe that true sustainability of the aquarium hobby can only be achieved through aquaculture.
